

Zero-Retention

Tax returns are processed in isolated, single-use compute environments. All source documents and intermediate data are permanently deleted after analysis. Only the final recommendations are retained.

Zero-Access

Tax returns are processed in fully automated, isolated compute environments. No human access is required for processing or analysis. Raw documents are not accessible to personnel during or after processing. No third-party providers retain or use uploaded documents beyond the duration of processing.

How it works

1. Upload: Encrypted tax return is securely uploaded (TLS 1.3).
2. Ephemeral Processing: A single-use isolated worker decrypts and processes the document.
3. AI Analysis: The system extracts relevant tax and financial signals to identify advisory opportunities.
4. Recommendation Output: A structured advisory opportunity report is generated.
5. Secure Deletion: The original PDF and all intermediate data (OCR, extracted fields, temporary files) are permanently deleted.
6. Worker Destruction: The compute environment is terminated immediately after processing.

Data Retention Policy

- We do not store tax returns
- We do not retain extracted data
- We do not use client data for training or model improvement
- We do not keep intermediate processing artifacts
- We retain only the final recommendation
